Amendments to the Claims

The following listing of claims will replace all prior versions and listings of claims in the application.

1. (Currently amended) An industrial controller capable of being employed in a distributed control system, wherein the distributed control system controls operations of a plurality of devices that operate together to perform a process, the industrial controller including I/O modules communicating signals with sensors and actuators attached to controlled machinery, the industrial controller comprising:

at least one processing component configured to perform a first plurality of program portions that operate in relation with one another as a first agent, the plurality of program portions including

a first program portion that controls agent-type behavior of the industrial controller; and

a second program portion executing a real-time control program that at least one of controls and monitors at least one of the devices via data exchanged with the I/O modules; and

at least one memory component that stores a data table further comprising information relating to the control or status of the device that is accessed for both reading and writing by each of the first and second program portions to allow communication between the first and second program portions.

2. (Currently Amended) The industrial controller of claim 1, wherein actuator signals generated by the second program portion for controlling one of the devices are communicated to the device by way of the data table, and wherein sensor signals generated by the device are communicated to the second program portion by way of the data table.

3. (Currently Amended) The industrial controller of claim 1, wherein the second program portion is written in a ladder logic ~~format~~.

4. (Currently amended) The industrial controller of claim 1, wherein at least a portion of the first program portion is written in a first language selected from the group consisting of C++, JAVA and another high-level programming language, and is capable of generating script-type messages in a second language selected from the group consisting of ~~JDL, KQML and XML~~Job Definition Language (JDL), Knowledge Query and Manipulation Language (KQML), and EXtensible Markup Language (XML).

5. (Currently Amended) The industrial controller of claim 1, wherein the agent-type behavior includes at least one of submitting requests for bids, and submitting bids, to other agents.

6. (Currently amended) The industrial controller of claim 1, wherein messages communicated between the first agent and other agents include a ~~FIP A ACL~~ Foundation for Intelligent Physical Agents (FIPA) Agent Communication Language (ACL) wrapper.

7. (Currently Amended) The industrial controller of claim 1, wherein the data table provides an array of memory locations that can be monitored and modified by each of the first and second program portions, and wherein monitoring of the data table occurs by at least one of direct polling and event-driven mechanisms.

8. (Currently Amended) The industrial controller of claim 1, wherein the first program portion is capable of modifying values stored in the data table, wherein the second program portion is capable of monitoring the values and capable of responding to changes occurring in the values, and wherein in at least some circumstances data table changes are affected by a priority of events.

9. (Currently Amended) The industrial controller of claim 1, wherein the second program portion is capable of modifying values stored in the data table, and the first program portion is capable of monitoring the values and capable of responding to changes occurring in the values.

10. (Currently Amended) The industrial controller of claim 9, wherein the second program portion provides a thread to the first program portion whenever the second program portion modifies the values, in order to notify the first program portion that the modifications have occurred.

11. (Cancelled)

12. (Currently Amended) The industrial controller of claim 1, further comprising:

a third program portion performed by the at least one processing component, wherein the third program portion at least one of controls and monitors a different one of the devices than the at least one device.

13. (Currently Amended) The industrial controller of claim 12, further comprising:

a fourth program portion performed by the at least one processing component, wherein the fourth program portion controls additional agent-type behavior of the industrial controller associated with a second agent, and wherein the fourth program portion is in communication with the third program portion by way of at least one of the first data table and a second data table.

14. (Currently Amended) The industrial controller of claim 1, further comprising:

a third program portion performed by the at least one processing component, wherein the third program portion controls additional agent-type behavior of the industrial controller associated with a second agent, and wherein the third program portion is in communication with at least one of the second program portion and a fourth program portion by way of at least one of the first data table and a second data table.

15. (Currently Amended) The industrial controller of claim 1, wherein the first program portion includes at least one of a planner portion, an execution controller portion, a diagnostics portion, an equipment model portion, an application-specific agent scripts portion and a generic interface program, wherein the programs are capable of interacting with one another and deploying industrial based firmware software and communication networks to fulfill control actions.

16. (Currently amended) A distributed control system for controlling a distributed process performed by a plurality of devices, the distributed control system comprising:

a first industrial controller including I/O modules communicating signals with sensors and actuators attached to controlled machinery, the first industrial industrial including a first processing component, wherein the first processing component is configured to perform a first program portion governing first agent-type behavior of a first agent implemented on the first industrial controller, and a second program portion governing operation of at least a~the first of the devices via a control program executed in real time to exchange data with the I/O modules; and

a second industrial controller including I/O modules communicating signals with sensors and actuators attached to controlled machinery, the second industrial industrial including a second processing component, wherein the second processing component is associated with at least a second of the devices and configured to perform a third program portion governing second agent-type behavior of a second agent implemented on the second industrial controller, and a fourth program portion

governing operation of at least a̶the second of the devices via a control program
executed in real time to exchange data with the I/O modules;

wherein the first and second industrial controllers are in communication by
way of a network; and

wherein the first program portion is in communication with the second
program portion by way of a first data table including information relating to the
control or status of at least the first of the devices wherein the first data table is
accessed for both reading and writing by the first and second program portions, and
the third program portion is in communication with the fourth program portion by
way of a second data table including information relating to the control or status of at
least the second of the devices wherein the second data table is accessed for both
reading and writing by the third and fourth program portions.

17. (Currently amended) The distributed control system of claim 16, wherein
each of the second and fourth program portions is written in a̶ ladder logic f̶o̶r̶m̶a̶t̶.

18. (Currently amended) The distributed control system of claim 16, wherein
each of the first and third program portions is capable of generating and processing
messages written in a language selected from the group consisting of J̶D̶L̶,̶ ̶X̶M̶L̶ ̶a̶n̶d̶
K̶Q̶M̶L̶Job Definition Language (JDL), Knowledge Query and Manipulation
Language (KQML), and EXtensible Markup Language (XML).

19. (Currently amended) The distributed control system of claim 18, wherein
the messages generated and processed by the first industrial controller and the third
industrial controller are wrapped in F̶I̶P̶-̶A̶-̶A̶C̶L̶ Foundation for Intelligent Physical
Agents (FIPA) Agent Communication Language (ACL) information.

20. (Currently amended) The distributed control system of claim 16, further
comprising a means for communicating with a third industrial controller of an
external organization, wherein the third industrial controller includes a third

processing component, wherein the third processing component is configured to perform a fifth program portion governing agent-type behavior.

21. (Original) The distributed control system of claim 16, wherein the first program portion includes at least one of a planner portion, an execution controller portion, a diagnostics portion, an equipment model portion, an application-specific agent scripts portion and a generic interface portion.

22. (Original) The distributed control system of claim 16, wherein the first and second agent-type behavior includes conducting negotiations with other agents.

23. (Original) The distributed control system of claim 16, wherein first communications between the second program portion and the first device also occur by way of the first data table, and second communications between the fourth program portion and the second device also occur by way of the second data table.

24. (Currently amended) In a <u>industrial</u> controller of a distributed control system, wherein the distributed control system operates to control a plurality of devices to perform a process, a method of communicating information between a first program portion and a second program portion, the method comprising:

provided a data table <u>including information relating to the control or status of the device</u> that is accessible by each of the first and second program portions <u>for both reading and writing</u>, wherein the first program portion is configured to govern agent-type behavior of the <u>industrial</u> controller and the second program portion is configured to at least one of control and monitor a first device of the plurality of devices;

sending first data from one of the first and second program portions to modify a value of the data table; and

providing the modified value of the data table to the other of the first and second program portions,

wherein the other of the first and second program portions experiences a change in its operation in response to the modified value.

25. (Original) The method of claim 24, further comprising:

generating a thread between the first and second program portions when the modifying of the value has occurred.

26. (Original) The method of claim 24, further comprising communicating second data between the device and the first program portion by way of the data table.

27. (Original) The method of claim 24, wherein the program portion that receives the modified value is the first program portion that governs agent-type behavior, and

wherein the modified value is representative of at least one of a piece of data and an event.

28. (Original) The method of claim 27, wherein in response to receiving the modified value, the first program portion matches the modified value with an application-specific script.

29. (Original) The method of claim 27, wherein in response to receiving the modified value, the first program portion performs at least one action including at least one of the following:

sends at least one of an additional piece of data and an additional event to the data table to cause a change in operation of at least one of the first program portion and an external device; and

modifies an operation in relation to another agent other than a first agent including the first and second program portions.

30. (Original) The method of claim 27, wherein the action is performed by one of a planner and an execution controller based upon an application-specific agent script.
